

DAY 1 - Network Devices

Purinat33

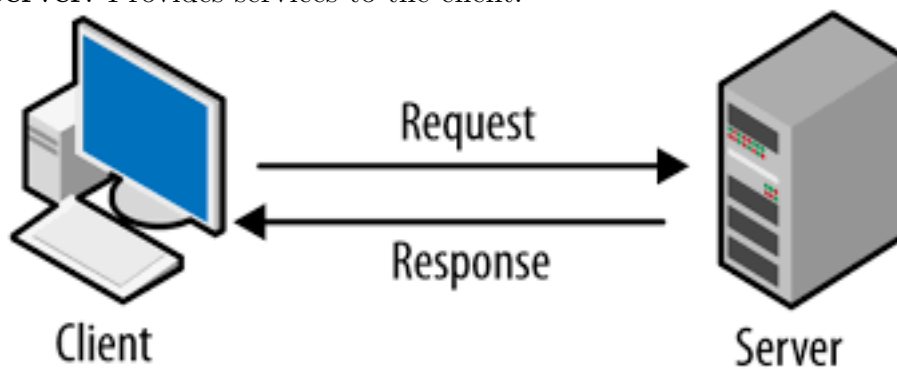

Networking Devices

Networking allows devices (**nodes**) to communicate.

Types of Nodes:

1. End Host or Endpoint:

1. **Client:** Accesses services from the server.
2. **Server:** Provides services to the client.

2. Intermediate:

1. **Switch:** Routes traffics **within** the same Local Area Network (the same **LAN**)
 - e.g. Cisco *Catalyst* Series

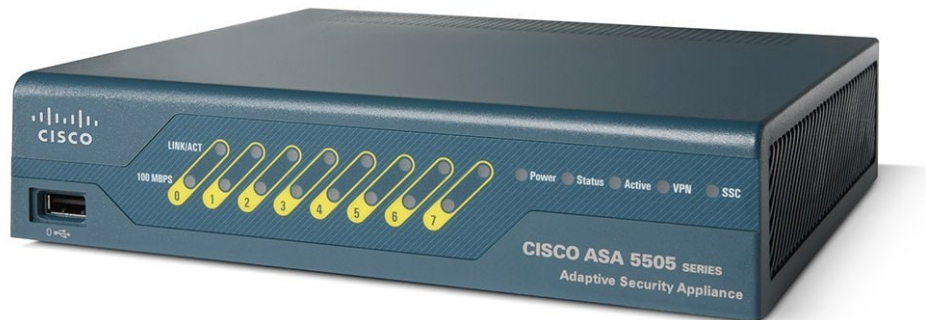

2. **Router:** Routes traffics **between** other networks (other LANs)

- e.g. Cisco *ISR* Series

3. **Firewall:** Monitor and filter traffics based on set of rules. Can be placed *outside* or *inside* a LAN

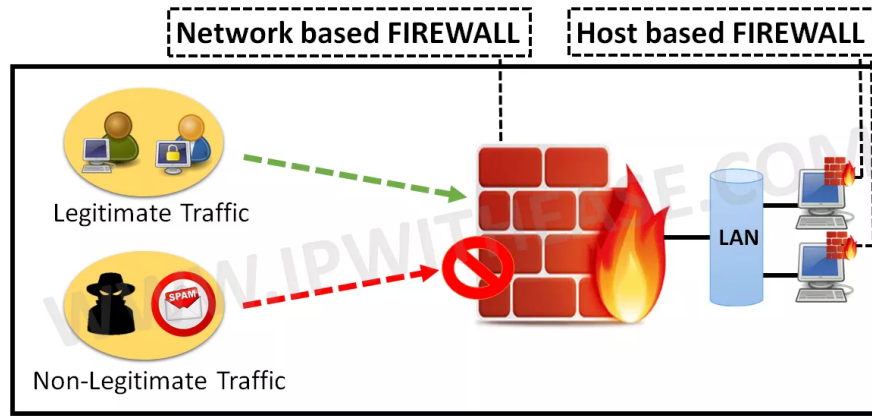

- e.g. Cisco *ASA* series (**Classic**)

- e.g. Cisco *Firepower* series (**Next-Generation**)

- **Network** vs. **Host-based** Firewall:

- **Network-Based** are hardware firewalls that filter traffics entering a network.
- **Host-Based** are software that filters traffics entering or leaving a *host*.
 - * **Host-Based Firewalls** are outside the scope of CCNA.

Packet Tracer Activity
